- ▶ About Myself
- ▶ Hardware Used
- ▶ Software Used

About Myself

- ▶ M.Sc. in computational biology
- ▶ Ph.D. in microbiology
- ▶ Samba Team member

Hardware Used

- ▶ 3x RaspberryPi2
- ▶ 4-port switch
- ▶ 4-port USB PSU

RaspberryPi2

- ▶ 900 MHz ARMv7 Cortex-A7 QuadCore
- ▶ 1 GB RAM
- ▶ 4 USB 2.0 ports
- ▶ 100 MbE

Source: Multicherry, CC BY-SA 4.0,
<https://commons.wikimedia.org/w/index.php?curid=38558176>

Software Used

- ▶ Arch Linux ARM
- ▶ GlusterFS
- ▶ Samba 4.4.2 / CTDB

- ▶ ARM port of Arch Linux
- ▶ Supports ARMv5 – ARMv7 hardware
- ▶ Lightweight
- ▶ Active community

GlusterFS

- ▶ Current release: 3.7.11
- ▶ Clustering for common, off-the-shelf hardware
- ▶ Packaged for ArchLinux

Samba 4

- ▶ Current release: Samba 4.4.3
- ▶ Active Directory Domain controller
- ▶ Scales from micro to macro

Demo

Hardware

Basic Setup

- ▶ Set up RaspberryPis
- ▶ It's in GitHub: <https://github.com/kblin/rpi-cluster>

```
# Push system on pre-partitioned SD card at /dev/mmcblk0
./install/format.sh

# restore host-specific config
./install/bootstrap.sh <hostname>

# Done :)
# Ok, actually, you still need to put SD into the
# RPi, boot, and pacman -S python2
```

Ansible

- ▶ Use to bootstrap the setup
- ▶ It's in GitHub: <https://github.com/kblin/rpi-ctdb-ansible>

```
# First install GlusterFS
ansible-playbook -i inventory install_gluster.yml

# For now, we need a custom version of the Samba packages
pacman -U samba*xz

# Then install Samba stuff
ansible-playbook -i inventory install_samba.yml]
```

- ▶ Need to add --with-clustering to ArchLinux build
 - ▶ Binaries packaged, config files not
 - ▶ Copy over files using Ansible
- ▶ Some fixes to config files needed for Arch
- ▶ Tweaks to startup scripts
- ▶ Details on GitHub

Samba

smb.conf

```
[global]
# Cluster settings
clustering = yes

# Load shares from registry
ctdb:registry.tdb=yes
include=registry
```

Samba (cont.)

```
net conf setparm global "workgroup" "CLUSTER"
net conf setparm global "netbios name" "storage"
net conf setparm global "security" "user"
net conf setparm global "idmap backend" "tdb2"

net conf addshare public /data/packages \
    writeable=y guest_ok=N "Demo share"
```

DNS

- ▶ Round-robin A record for public IPs
- ▶ Here: dnsmasq and /etc/hosts
- ▶ Should use BIND in real setup
- ▶ Or maybe Samba DNS once we implement round-robin

Remaining Issues

Demo

SCHED_FIFO

- ▶ Not working in ARM for some reason
- ▶ Fortunately, CTDB doesn't need it

- ▶ Locking doesn't work properly (yet)

Future Plans

- ▶ Get CTDB packaged in ArchLinux
- ▶ Go fully self-contained
- ▶ 2-node cluster + 1 Samba AD DC?

Thank you

- ▶ Questions?
- ▶ ArchLinuxArm bootstrapping: <https://github.com/kblin/rpi-cluster>
- ▶ Ansible CTDB setup: <https://github.com/kblin/rpi-ctdb-ansible>
